ATTN: Dr. F. Golby from Wilfried Demberger

Dear Sirs,

On the basis of 1½ years experience as head of the science department, I would like to submit a research concept for your evaluation in which the priorities are set on the basis of our current state of knowledge. Research planning is urgently needed to prevent any disappointments of the expectations which are placed upon science. The research concept should not be evaluated as usually by the Research Council but by the Industry itself. Only then will there be a guarantee that the available means will be used properly and for the proper goals.

Taking the scientific and industrial-political viewpoints into account, it is my opinion that nicotine should be the main point in research planning:

A). Scientific viewpoints

In contrast to the acute effect of nicotine very little is known about the long term effect of nicotine on the human organism. There are many theories which link nicotine with diseases occurring more frequently in smoking. However, these theories are not convincing. There are reasons which allow one to assume that nicotine is unjustly blamed.

B). Industrial-political viewpoints

If one can determine that a dose of nicotine, such a dose as the smoker receives in smoking, is unobjectionable to the human organism, then one has created the preconditions for the manufacture of cigarettes which deliver sufficient nicotine and as little as possible condensate.
