Rick,

I think this has already been accomplished via email messages. I will forward you the exchanges if you would like more detail, but the bottom line is that there appears to be no epi studies involving charcoal/carbon filters so there is little for the group to discuss. With regard to funding such a study, it would be worthwhile to wait until we have the SCoR product available so that we could do a meaningful study. Let me know if you would like more info. and I will be happy to share it with you.

Debbie

Debbie, given that you have the lead for SCoR, I would suggest you take the lead on this stuff. come up with a propose path forward.

I think this is a good idea. Please note that the amount and activation state of the carbon/charcoal is very important in determining what if any effect may be present, therefore just looking at filters with and without carbon/charcoal may be meaningless. SCoR is being very proactive in this regard and is even considering some sort of "expiration date".

Thanks, Ted, for the update. In the context of SCoR and other concepts of future products - would it be advisable to put together a Consensus group on this issue to develop a full understanding of the current status of epidemiological knowledge and to propose research opportunities? Is this an opportunity to work with the AHF? Has Kohji looked into this in Japan (publications in Japanese; Smoking Research Foundation)? What about a 6-months exposure study in humans (US) using cigarettes in the market with and without charcoal filters?

Best regards,
Roger
