SUBJECT	Telcom Testing Proposal	
	DATE	5/10/78

Background

As part of the creative development diagnostic procedures, the KOOL Brand Group, through Ted Bates, Inc., has used the Telcom eye camera technique as a preliminary evaluation tool for evaluating exploratory advertising. We have found this technique to have the following advantages:

1. Does not require finished material since slides can be made from comprehensive or C-print comps thereby saving production costs.
2. Since the technique focuses in on actual eye pattern movement and time spent on each element of the ad, one can experiment with different copy treatments, layout variations, package positions, etc. at very minimal cost.
3. The technique provides diagnostic information as to attribute playback, recall and interest.
4. The turnaround time is extremely rapid due to the fact that finished materials are not required.

This technique is recommended as a preliminary evaluation tool; not as a replacement for more standard copy development evaluation methods such as ASI. It is felt that the technique can have a great deal of merit when used in conjunction with ASI.

Telcom Proposal

On May 8, Mr. Lee Weinblatt, President of Telcom, called me to suggest a specific proposal wherein for \$100,000, guaranteed by B&W, Telcom would provide 40 evaluation sessions of 100 respondents each over a 12-month period. They are requesting that we "guarantee" to spend \$100,000 with them and in exchange for this they would provide 40 sessions of 100 respondents each at approximately 40% of rate card (i.e., \$100,000). In addition to this cost saving, B&W would also accrue the following advantages:

- A. Category Exclusivity - No other cigarette company could retain Telcom.
