A number of investigations have now isolated the common kitchen gas range as a major source of indoor pollutants.¹⁻¹⁰ All of these studies have been concerned with normal operation of gas ranges—for cooking. However, it has been suspected that gas ranges are used as well as supplemental

sources of heat. As the extent of that use is not known, an attempt was made to assess the prevalence of gas range heating in one urban environment.

The first exploration of the extensiveness of potential indoor exposures was done in New York City with the cooperation of Con Edison Co. of New York. In 1977, Con Edison provided gas service to about 1.2 million customers in West
